TITLE : DISPLAY PLATE AND HOLDING BASE
 THEREOF IN PACHINKO HALL

ABSTRACT : PROBLEM TO BE SOLVED: To inform a managing computer of the status of the held ball concept, the concept of personal right and the skate of leaving seats at an inexpensive method without changing the current position of personnel by arranging display plates having different meanings to be given a detectable difference and a holding base to allow detection of the difference.

SOLUTION: Detection switches 7-11 are of a (b) contact tape and when a display plate 1 is inserted, one bored specific switch alone is turned ON. There is no boring in any display plate at the part of a display plate insertion detecting switch 11 and this switch 11 alone is of a (a) contact type and turned ON when the display plate 1 is inserted. In a managing computer, when a display plate insertion detecting switch 11 is turned ON, the type of the held ball concept is judged depending on which switch is ON, that for normal start, lucky state, non-quantity position or spare. A motor stop signal cut-off switch 12 is of a (b) contact switch which is normally ON and turned OFF when a wrong display plate 1 is inserted.
